IPDACT and VISORALARM PLUS Released

August 14, 2007
Document FLPA07-08-2

Fire-Lite is pleased to announce the availability of the IPDACT and VisorALARM® PLUS Internet communicator products.

The IPDACT communication module allows Fire-Lite panels to use any customer provided IP network connection (LAN, internet, cable, ADSL), as an alternate communication path to transmit alarms to central stations. It offers new performance and functionality enhancements to traditional communicators. The IPDACT is UL 864 ninth edition listed and compatible with the MS-9050UD, MS-9200UDLS, MS-9600LS/DACTUD, MS-5UD and MS-10UD. The HP-300ULX power supply can be used when more power is required. (Download the special Mounting Options Product Installation Document (PID) 53109 (http://www.firelite.com/manuals/pids/53109.pdf) for more information.)

The IPDACT allows for faster and more economic alarm transmissions, improving response times and decreasing costs. It offers value-added features such as supervised line functionality, allowing a central station to detect any off-line alarm panels within seconds. On the central station side, a compatible VisorALARM Plus 2U IP receiver from the Teldat Corporation integrates

seamlessly into conventional central station architectures. Unlike traditional communicators which can only be supervised with a 24 hour test signal, the IPDACT has always-on high speed lines that allow for line supervision (sabotage detection) and immediate notification of a communications line fault. In the event the network is unavailable, the unit drops voltage to the alarm panel thereby switching communication to the panel's backup phone line. The receiver can also be used to monitor Contact ID™ security panels using a Teldat Corporation mIP communicator. The receiver can emulate several popular receiver brands such that central station automation software is instantly compatible with no upgrades required.
